Paul Muli

Team Charter

SLU 06007 DVT Team 14 Team Charter

Team Members	• Nial Jai George (nialjaigeorge@gmail.com) • Samkelisiwe Mhlungu (sdlamini111@gmail.com) • Khyati Chintha (chintha.khyati@gmail.com) • Siddhi Majarkhede (majarkhedesiddhi@gmail.com) • Laxmi Kumari (laxmikumari4@amityonline.com) • Soumojit Maitra (soumojitcloud@gmail.com) • Murali Krishna M (muraliranikrishna@gmail.com) • Paul Muli (mulikituku086@gmail.com)
Team Lead	Soumojit Maitra (soumojitcloud@gmail.com)
Team Members Roles and Responsibilities	Dashboard Creation: Nial & Siddhi <u>DOCUMENTATION:</u> Section 1 – Team Charter: Sam Section 2 – Executive Summary & Dashboard Overview: Laxmi Section 3 – Dashboard Features & User Guide: Khyati Section 4 – Data Analysis & Business Insights: Soumojit Section 5 – Recommendations & Conclusion: Paul & Murali Finalizing, Reviewing the Report: Soumojit
Mission, Vision Objectives & Core Values	Mission: To work together to deliver practical, high-quality recommendations that meet our sponsor's needs and can be implemented successfully. Vision Objectives:

	Success means working collaboratively, communicating openly, meeting deadlines, and delivering a valuable outcome for our sponsor. Core Values: • Integrity: We act honestly, ethically, and transparently in all our work. • Accountability: We take responsibility for our tasks and commitments. • Discipline: We stay organized, meet deadlines, and maintain high standards. • Respect: We value each other's ideas, communicate professionally, and embrace diversity. • Innovation: We encourage creative thinking and practical solutions to deliver value.
--	---

Internal Checks, Balances, and Reviews	Team Accountability and Performance
Accountability Mechanics	• Each team member is responsible for completing their assigned tasks on time, communicating progress, and asking for support when needed. • Sub-teams will provide brief progress updates before each full team meeting and notify the team of any challenges that may affect deadlines. • The full team will meet once a week (or more frequently if needed) to review progress, discuss challenges, assign new tasks, and ensure everyone is aligned with the project goals. • Individual performance will be measured using SMART goals, ensuring tasks are: - Specific: Clearly defined responsibilities. - Measurable: Progress tracked through completed deliverables. - Achievable: Tasks assigned according to each member's skills and capacity. - Realistic: Deadlines are practical and agreed upon by the team. - Time-based: All tasks have clear due dates.
Operations: Assignments	Utilizing the insights gathered from prior analysis, design and construct a dashboard that

	enables stakeholders to quickly comprehend key trends and performance indicators. Provide the resources that will introduce us to dashboard design principles, visualization best practices, and effective techniques for communicating insights.
Meetings	Team members met via Google Meet on 21 July 2026. We discussed week 3 deliverables to make sure everyone understood our tasks and responsibilities, and at the end we were assigned to our tasks and responsibilities.
Communication Guidelines & Status Updates	Communication Guidelines: The team lead made sure that every team member knew and understood their task; he shared updates and communicated mainly on Google Chat. Status Updates: Team members shared the project through Google Chat, and we used Google Docs for easy access to view and update the documents.
Deadlines	Project Draft is due July 26, The final project is due by July 27.

Executive Summary & Dashboard Overview

2.1 Executive Summary

The **Opportunity Dataset Insight Dashboard** was developed using **Google Looker Studio** to present the Opportunity Dataset in a simple, interactive, and easy-to-understand format. The main purpose of the dashboard is to help users analyze opportunities based on different aspects such as category, location, posting trends, and financial details.

The dashboard contains **5,730 opportunity records** collected from **10 different categories** between **August 2022 and May 2026**. It uses KPI cards, charts, tables, and interactive filters to summarize the data and highlight important insights.

Some of the major findings from the dashboard include:

- Internship opportunities have the highest number of listings.
- Around **79% of the opportunities are free**.
- Nearly **75% of the opportunities are remote or work-from-home**.
- Most opportunities have a duration measured in **weeks**.
- The highest number of opportunities were posted during **2023 and 2024**.
- **USD** is the most commonly used currency for scholarship amounts.

Overall, the dashboard makes it easier to understand large amounts of data and helps users identify important trends and patterns quickly.

2.2 Project Objective

The main objective of this project was to design an interactive dashboard that provides meaningful insights from the Opportunity Dataset. Instead of analyzing raw data manually, the dashboard allows users to explore information through visualizations and filters.

The project was developed with the following objectives:

- To provide a clear overview of the Opportunity Dataset.
 - To analyze opportunities based on category, location, and posting trends.
 - To compare free and paid opportunities.
 - To study scholarship amounts and financial information.
 - To create an interactive dashboard where users can filter data according to their requirements.
 - To support better understanding and decision-making through data visualization.
-

2.3 Dashboard Overview

Figure 2.1: Overview Dashboard

The dashboard is divided into **five pages**, with each page focusing on a different part of the dataset.

1. Overview

This page provides a summary of the complete dataset using KPI cards and charts. It displays the total number of opportunities, percentage of free opportunities, percentage of remote opportunities, and category-wise opportunity distribution.

2. Sign-up & Category Performance

This page compares different opportunity categories. It shows the number of opportunities, average scholarship amount, average fee, duration type, and the distribution of free and paid opportunities.

3. Trends Over Time

This page focuses on how opportunity postings have changed over time. It includes monthly and yearly trend charts, helping users identify periods with higher or lower activity.

Figure 2.2: Trends Over Time Dashboard

4. Location Distribution

This page analyzes the locations of opportunities. It compares work-from-home, virtual, and physical opportunities while also showing category-wise location distribution.

5. Financial & Scholarship

This page provides financial insights by showing the percentage of free and paid opportunities, average scholarship amount, currency distribution, and duration units used across the dataset.

2.4 Dashboard Layout

The dashboard follows a simple and consistent layout across all pages to make navigation easier.

Each dashboard page includes:

- A navigation panel on the left side to switch between dashboard pages.
- Interactive filters for **Category**, **Location**, and **Date Range**.
- KPI cards at the top displaying important summary statistics.
- Charts and tables in the main section to present detailed analysis.
- Information boxes that explain how to read each page and highlight key observations.

This consistent structure allows users to quickly understand the dashboard and compare information across different pages.

2.5 Design Philosophy & Color Theme

The dashboard was designed with the goal of keeping the information clear, organized, and visually appealing.

A **dark background** has been used throughout the dashboard to improve readability and reduce visual clutter. Bright **orange** is used to highlight important KPIs, headings, and charts, making key information stand out. White and light grey text is used for labels and descriptions to provide good contrast against the dark background.

The dashboard also follows a consistent design style by using:

- Uniform fonts and formatting across all pages.
- Similar placement of filters and KPI cards.
- Consistent chart styles and colors.
- Simple navigation for a better user experience.

This design approach makes the dashboard easy to use while helping users focus on the most important insights without feeling overwhelmed.

Figure 2.3: Financial & Scholarship Dashboard

Dashboard Features and User Guide

3.1 Introduction

3.1.1 Purpose of the Dashboard

The Week 3 Insight Dashboard provides an interactive, visual interface to the cleaned Opportunity dataset (5,730 records, 20 fields), allowing stakeholders to explore catalog composition, posting activity over time, delivery location, and financial/scholarship structure without querying the underlying dataset directly. It consolidates the findings already established in the Week 1 data cleaning and Week 2 exploratory data analysis into a browsable, filterable interface.

1.2 Objectives of the Dashboard

- Summarize the opportunity portfolio's size and category composition at a glance.
- Visualize how opportunity posting activity has trended over time (August 2022 – May 2026).
- Show the balance between remote and physically located opportunities.
- Present the financial and microscholarship structure of the portfolio, including the free-versus-paid split and currency mix.
- Allow users to filter and cross-filter these views by category, location, and date range.

1.3 Intended Users

The dashboard is designed to serve two audiences within a single report: internal operations and content-management staff who need a working view of catalog composition and data coverage, and business stakeholders who need a summarized view of volume, category mix, and financial structure. Both audiences are served through the same five pages rather than through separate dashboards.

1.4 How the Dashboard Supports Business Decision-Making

By presenting category volume, temporal trends, location mix, and financial structure in one interactive interface, the dashboard allows stakeholders to identify which opportunity categories dominate the portfolio, when posting activity has been highest or lowest, how reliant the portfolio is on remote delivery, and what share of opportunities are free versus paid. These views support decisions such as prioritizing category-level content review, planning around historical posting-volume patterns, and understanding the portfolio's current cost structure. The dataset used to build the dashboard is the cleaned, analysis-ready Opportunity dataset documented in the Week 1 and Week 2 deliverables.

3.2. Dashboard Overview

3.2.1 Overall Layout

Every page of the dashboard follows the same two-panel layout within the main content area: a left-hand orange gradient control panel containing the page title, three filter controls (Category, Location, Select date range), a short contextual insights box, and a set of reference links; and a right-hand dark panel containing the page's KPI cards and visualizations. A separate, persistent dark sidebar to the far left of the browser window lists all five dashboard pages and indicates the currently active page.

3.2.2 Organization of Dashboard Pages

The dashboard consists of five pages, accessed through the left navigation sidebar: Overview, Sign-up & Category Performance, Trends Over Time, Location Distribution, and Financial & Scholarship. Each page focuses on one analytical area of the dataset, described further in Section 3.

3.2.3 Navigation Design

Page navigation is handled through a fixed left-hand sidebar listing all five page names as clickable menu items; the active page is visually highlighted with a shaded rounded rectangle. This sidebar is present and identical on every page, giving users a consistent way to move between analytical views. Within each page, a secondary set of controls (the three filter dropdowns) allows narrowing the data shown without leaving the page.

3.2.4 Dashboard Theme and Design Philosophy

The dashboard uses a dark theme throughout: near-black panel backgrounds for charts and KPI cards, a dark navy sidebar for page navigation, and an orange-to-red gradient panel for each page's control area. This creates strong visual contrast for the orange-highlighted KPI values and chart bars against the dark background, and gives the report a consistent, presentation-oriented appearance across all five pages.

3.2.5 Color Scheme and Its Significance

Orange and red tones are used consistently as the primary data color across KPI values, bar charts, and the control panel background, set against dark navy and black backgrounds. This single-accent-color approach means color is used for visual branding and emphasis rather than to encode a separate categorical dimension in most charts; the two exceptions are the Category $\times$ Duration Type chart and the Category $\times$ Free vs Paid chart on the Sign-up & Category Performance page, and the Work From Home / Virtual / Kolkata legend on the Location Distribution page, each of which uses a small multi-color legend to distinguish sub-categories.

3.2.6 Overall User Experience

Each page presents a bounded set of KPI cards and two to four charts or tables, accompanied by a "Key Observation(s)" or "Key Insights" summary box in the user's own words; the Sign-up & Category Performance, Trends Over Time, Location Distribution, and Financial & Scholarship pages additionally include a short "How to Read This Page" instructional box, while the Overview page carries only the Key Insights box. This pairing of raw visuals with plain-language guidance is a consistent feature across all five pages and is intended to help users unfamiliar with the underlying dataset interpret each page without additional explanation.

Figure 1. Dashboard Home Page (Overview). Shows the persistent left-hand page navigation, the orange control panel with Category/Location/date-range filters and a Key Insights box, and the four Overview KPI cards with the category volume bar chart.

3.3. Dashboard Features

This section describes every visual component actually present in the dashboard. For each type, the purpose, business value, data displayed, and interpretation guidance are described based only on what is visible in the supplied screenshots.

3.3.1 KPI Cards

Purpose: KPI cards give an at-a-glance numeric summary at the top of every page, before the user engages with any chart. **Business value:** they let a user confirm scale and headline metrics (e.g., total record count, free/remote share) without reading a chart. **Data displayed:** aggregate counts, percentages, and date values computed from the Opportunity dataset. **Interpretation:** each card pairs a small field-name label with a large formatted value; users read these left to right as the page's headline summary. Across the five pages, 20 individual KPI cards are displayed in total; three metrics (Total Opportunities, % Free, % Remote) repeat on more than one page, giving 16 distinct KPI metrics, each detailed individually in Section 4.

Figure 2. Close-up of the four KPI cards on the Overview page (Total Opportunities, Total Categories, % Free Opportunities, % Remote Opportunities), illustrating the card format used consistently across all five pages.

3.3.2 Bar and Column Charts

Purpose: compare a measure (typically opportunity count, or average fee/microscholarship) across a categorical dimension. **Business value:** bar charts make category-level differences in volume or financial value immediately visible. **Data displayed:** opportunity counts or averages broken down by category, location, currency, or duration unit. **Interpretation:** longer bars represent larger values; several charts

(Category × Duration Type, Category × Free vs Paid, Category × Location) use stacked or grouped bars with a color-coded legend to show a second dimension within each category.

3.3.3 Line Charts

Purpose: show how opportunity posting volume changes over time. Business value: identifies peak and low periods of activity for operational planning. Data displayed: the "Opportunities Posted Per Month" chart on the Trends Over Time page, plotting monthly opportunity counts from August 2022 to May 2026. Interpretation: the line's peaks and troughs indicate months of higher or lower posting activity; the chart's own annotation notes a batch-posting pattern rather than a smooth trend.

3.3.4 Donut Charts

Purpose: show a simple two-way proportional split. Business value: communicates a headline ratio (e.g., free vs. paid, remote location split) more intuitively than a table. Data displayed: two donut charts are present — the Location Distribution Donut (Location Distribution page) and the Free vs Paid Opportunities Distribution donut (Financial & Scholarship page). Interpretation: each segment's share is labeled as a percentage directly on the chart.

Pie charts (as a distinct chart type from donut charts) are not present in the dashboard; both proportional visuals observed use the donut format.

3.3.5 Tables

Purpose: present exact per-category or per-location figures that are difficult to read precisely off a bar chart. Business value: supports users who need specific numbers (e.g., exact average fee per category) rather than a visual comparison. Data displayed: the Category Performance table (Sign-up & Category Performance page: Category, Opportunities, Avg Scholarship, Avg Fee) and the Location table (Location Distribution page: Location, Opportunities, Avg Scholarship). Interpretation: both tables are paginated (e.g., "1–10/10", "1–3/3" with previous/next controls) and the Category table's Opportunities column displays a sort indicator, suggesting the table is sorted by that column.

3.3.6 Maps

Not implemented in the current dashboard. Although a Location Distribution page exists, it presents location as a categorical donut chart and bar/table breakdown (Work From Home, Virtual, Kolkata) rather than a geographic map visual.

3.3.7 Trend Charts

Covered under Line Charts (Section 3.3) and the Opportunities by Year column chart on the Trends Over Time page, which aggregates the same underlying trend by calendar year rather than by month.

3.3.8 Additional Custom Visuals

No additional custom visual types beyond those listed above (KPI cards, bar/column charts, one line chart, donut charts, and two tables) were observed in the supplied screenshots.

3.3.4. KPI Cards Overview

A methodology note applies to the Calculation column below: the dashboard's underlying field formulas were not directly visible in the supplied screenshots (no formula bar or field-definition view was captured). The calculations shown are the most probable logic given the displayed value, the field name

shown in small text beneath several KPI cards, and the underlying dataset structure documented in the Week 1–2 deliverables. These should be verified against the dashboard's actual field definitions before final publication.

Metric Name	Business Purpose	Calculation (Inferred)	Interpretation	Why It Matters
Total Opportunities	Overall portfolio size	COUNT(opportunity_id)	5,730 records in the dataset	Baseline scale for all other metrics
Total Categories	Breadth of the catalog	COUNT(DISTINCT category)	10 distinct categories	Shows catalog diversity
% Free Opportunities	Share requiring no fee	COUNT(fee = 0) / COUNT(*)	78.85% of opportunities are free	Indicates low cost barrier to entry
% Remote Opportunities	Share delivered remotely	COUNT(location IN {WFH, Virtual}) / COUNT(*)	74.59% of opportunities are remote	Confirms a digital-first delivery model
Largest Category	Identifies the dominant category	MAX(COUNT(*) BY category)	Internship, 1,591 records	Highlights where the portfolio is concentrated
Smallest Category	Identifies the least-represented category	MIN(COUNT(*) BY category)	Program XploreU, 2 records each	Flags categories with minimal presence
Avg Opportunities / Category	Average category size	COUNT(*) / COUNT(DISTINCT category)	573	Should be read alongside category-size variation, not in isolation
Top Category Share	Concentration of the largest category	MAX(category count) / Total Opportunities	27.77%	Quantifies portfolio concentration
First Post Date	Earliest recorded listing	MIN(created_at)	Aug 8, 2022	Anchors the start of the observed time range

Last Post Date	Latest recorded listing	MAX(created_at)	May 28, 2026	Anchors the end of the observed time range; end date should be read as a partial period
Months with Postings	Count of distinct months with at least one posting (not the full date-range span)	Distinct Year-Month combinations with ≥ 1 posting (field: Year_Month) — confirmed by dashboard owner	Displayed as 13	Verified correct — see note below for the confirmed explanation and the full list of posting months
Most Common Location	Dominant delivery location	MODE(location)	Work From Home, 2,356 records	Identifies the leading delivery format
Physical Opportunities	Count of non-remote listings	COUNT(location NOT IN {WFH, Virtual, blank})	1	Shows how rare physically located opportunities are
Avg Microscholarship	Average incentive value	AVERAGE(microscholarship)	168	Mean is pulled upward by a smaller number of higher values; median/standard value (120) is more representative
Standard Amount	Most common microscholarship value	MODE(microscholarship)	120	Represents the typical, standardized award level
% Paid Opportunities	Share requiring a fee	COUNT(fee > 0) / COUNT(*)	21.10%	Complement of % Free Opportunities

Note on Months with Postings: this KPI (previously labeled "Months Covered") has been confirmed correct by the dashboard owner, George. The metric counts the distinct Year-Month combinations in which at least one opportunity was posted, not the total number of months in the overall date range. Although the dataset spans approximately 46 possible months from the First Post Date (Aug 2022) to the

Last Post Date (May 2026), opportunities were posted in bursts rather than continuously, so only 13 distinct months contain any postings.

This batch-posting pattern is also visible in the "Opportunities Posted Per Month" line chart on the Trends Over Time page (Figure 5), where activity appears as a series of peaks separated by gaps rather than a continuous trend. The KPI card label was updated from "Months Covered" to "Months with Postings" to make this distinction clear to report readers. The 13 months with recorded postings are:

- Aug 2022, Dec 2022, Mar 2023, Jul 2023, Nov 2023, Mar 2024, Jul 2024, Oct 2024, Feb 2025, Jun 2025, Oct 2025, Feb 2026, and May 2026.

This resolves the discrepancy previously flagged for review in this section and in Section 11.4.

3.3.5. Filters and Slicers

The dashboard uses the term "filter" for its three interactive controls, which are functionally equivalent to what Power BI terms slicers. All three filters appear identically on every page's orange control panel.

Filter	Purpose	How It Interacts with Other Filters	How It Improves Exploration
Category	Narrows all visuals on the page to one or more selected opportunity categories.	Combines with Location and date range as a cumulative (AND) filter, based on standard dashboard filter behavior; this could not be independently confirmed by interacting with a live report from static screenshots alone.	Lets a user isolate a single category (e.g., Internship) to inspect its trend, location, or financial pattern in detail.
Location	Narrows all visuals on the page to a selected location value.	Combines with Category and date range; selection mode (single vs. multi-select) was not visible in the supplied screenshots.	Lets a user isolate remote vs. specified-location records.
Select date range	Narrows all visuals on the page to a selected date period.	Combines with Category and Location; the specific field it filters on (created_at, last_date_to_apply, or another date field) was not confirmable from the supplied screenshots.	Lets a user focus on a specific posting period, such as the 2023–2024 peak.

3.6. Drill-down and Interactive Features

3.6.1 Drill-down Functionality

No drill-down functionality has been implemented in the current dashboard. All charts display a single level of granularity (e.g., category, location, duration unit) with no visible hierarchy controls, expand/collapse icons, or drill up/down affordances in any of the supplied screenshots.

3.6.2 Cross-filtering

Cross-filtering is documented directly in the dashboard's own on-page instructions. The Sign-up & Category Performance page states "click a bar or row to cross-filter," the Trends Over Time page states

"click any month or year to cross-filter the other visuals," and the Location Distribution page states "filter and click any bar/slice to cross-filter." This indicates cross-filtering is implemented on at least these three pages; the interactive behavior itself could not be independently verified from static screenshots, since no screenshot captures a post-click, cross-filtered state.

3.6.3 Cross-highlighting

Cross-highlighting is not separately documented from cross-filtering in the on-page instructions, and no screenshot demonstrates a highlighted (partially dimmed) selection state distinct from a filtered one.

3.6.4 Tooltips

Tooltip behavior cannot be directly confirmed from static screenshots, as tooltips display only on hover and none of the supplied images capture a hover state.

3.6.5 Sorting

The Category Performance table on the Sign-up & Category Performance page displays a sort indicator on the Opportunities column, and its rows are shown in descending order by that column. This indicates the table supports sorting; whether other columns are also independently sortable could not be confirmed from the supplied screenshots.

3.6.6 Reset Functionality

Not implemented in the current dashboard, based on the supplied screenshots. No dedicated "Reset filters" or "Clear all" control is visible on any page.

3.6.7 Navigation Buttons

The left-hand sidebar (Overview, Sign-up & Category Performance, Trends Over Time, Location Distribution, Financial & Scholarship) functions as the dashboard's primary navigation control. In addition, each page's orange control panel includes a "Links" section with three reference hyperlinks — Cleaned Dataset, EDA Workflow, and Visualizations Workflow — which appear to link to external supporting resources rather than to other dashboard pages.

3.6.8 Bookmarks

Not visible in the supplied screenshots. No bookmark controls or saved-view functionality was observed.

3.7. Dashboard Navigation Guide

1. Open the dashboard using the shared link. The report loads on the Overview page by default, showing the top-level KPI cards and category bar chart.
2. Use the left-hand sidebar to move between pages: click Overview, Sign-up & Category Performance, Trends Over Time, Location Distribution, or Financial & Scholarship. The active page is highlighted.
3. On any page, use the Category dropdown in the orange control panel to narrow all visuals on that page to one or more categories.
4. Use the Location dropdown to narrow all visuals to a specific location value.
5. Use the Select date range control to narrow all visuals to a specific time period.

6. Click directly on a bar, table row, or donut slice to cross-filter the other visuals on the same page, per the on-page "How to Read This Page" instructions (see Section 6.2).
7. Read the KPI cards at the top of the page first for a headline summary, then review the charts and tables below for detail, and the "How to Read This Page" / "Key Observations" boxes for guided interpretation.

Best practice for dashboard usage: apply filters before drawing conclusions from a KPI card, since several KPI cards (e.g., Total Opportunities) reflect the current filter state rather than always the full 5,730-record dataset; and interpret each page's charts together with its KPI cards and guidance text rather than a single visual in isolation.

3.8. User Guide with Practical Examples

The following four walkthroughs describe how a user would apply each filter scenario. The screenshots below show each relevant page in its default (unfiltered) state, since none of the supplied screenshots capture a filter actually applied; steps and expected results are described based on the filter controls and cross-filter behavior documented on each page.

Example 1 – Filter by Opportunity Category

Objective: isolate a single category (e.g., Internship) to examine its size, duration mix, and free-versus-paid structure in detail.

1. Navigate to the Sign-up & Category Performance page.
2. Open the Category filter and select Internship.
3. Review the updated KPI cards, category table, and the two stacked bar charts (Category × Duration Type, Category × Free vs Paid).

Expected dashboard behavior: all visuals on the page narrow to Internship-only records; the category table would show a single row, and both stacked bar charts would show a single category bar.

Business insight obtained: with Internship isolated, a user can directly compare its average fee and scholarship against the page's earlier all-category view (Internship: 1,591 opportunities, average scholarship 165.38, average fee 60.97, per the default view in Figure 3).

Figure 3. Sign-up & Category Performance page shown in its default (all-category) state. This is the page a user would apply the Category filter on to produce the single-category view described in Example 1; a screenshot of the filtered result was not available in the supplied evidence.

Example 2 – Filter by Location

Objective: isolate a single location value (e.g., Virtual) to examine its category and scholarship breakdown.

1. Navigate to the Location Distribution page.
2. Open the Location filter and select Virtual.
3. Review the updated KPI cards, donut chart, category bar chart, and location table.

Expected dashboard behavior: all visuals on the page narrow to Virtual-only records; the donut chart would show a single segment, and the location table would show a single row (Virtual: 1,918 opportunities, average scholarship 196.78, per the default view in Figure 4).

Business insight obtained: isolating Virtual allows a direct comparison against Work From Home's 2,356 opportunities and 168 average scholarship, clarifying which remote format carries a higher average incentive.

Figure 4. Location Distribution page shown in its default (all-location) state. This is the page a user would apply the Location filter on to produce the single-location view described in Example 2; a screenshot of the filtered result was not available in the supplied evidence.

Example 3 – Filter by Year

Objective: isolate a single year (e.g., 2024, the peak posting year) to examine that period's monthly pattern in detail.

1. Navigate to the Trends Over Time page.
2. Open the Select date range control and set the range to cover 2024 only.
3. Review the updated KPI cards and the two charts (Opportunities Posted Per Month, Opportunities by Year).

Expected dashboard behavior: the Total Opportunities KPI and both charts would narrow to 2024-only records; the monthly line chart would show only 2024's twelve months, and the yearly bar chart would show a single bar (2024: 2,127 opportunities, per the default view in Figure 5).

Business insight obtained: isolating 2024 lets a user examine which specific months within that year drove the year's total, beyond what the all-years default view in Figure 5 shows.

Figure 5. Trend Analysis — Trends Over Time page shown in its default (all-years) state. This is the page a user would apply the Select date range control on to produce the single-year view described in Example 3; a screenshot of the filtered result was not available in the supplied evidence.

Example 4 – Apply Multiple Filters Together

Objective: combine Category, Location, and date range filters simultaneously to answer a compound question, such as "how many Internship opportunities were Virtual and posted in 2024."

1. Navigate to any dashboard page (e.g., Sign-up & Category Performance).
2. Set the Category filter to Internship.
3. Set the Location filter to Virtual.
4. Set the Select date range control to 2024.
5. Review the resulting KPI cards and visuals, now narrowed by all three filters at once.

Expected dashboard behavior: since the three filter controls appear identically on every page, applying all three should narrow every visual on the current page to records matching all three conditions simultaneously (a compound AND filter), consistent with standard dashboard filter behavior; this compound interaction could not be independently confirmed from the supplied screenshots, since none shows more than one filter applied at a time.

Business insight obtained: this combined view would let a user validate category-level and location-level patterns within a specific, narrower time window, rather than relying on the portfolio-wide averages shown in the default views.

3.9. Dashboard Screenshots

This section consolidates the figures referenced throughout this report for quick reference.

Figure	Title	Section	Filter State
Figure 1	Dashboard Home Page	Section 2.6	Default (unfiltered)

Figure 2	KPI Cards (close-up)	Section 3.1	Default (unfiltered)
Figure 3	Opportunity Category Filter — Sign-up & Category Performance page	Section Example 1	8, Default (unfiltered)
Figure 4	Location Analysis — Location Distribution page	Section Example 2	8, Default (unfiltered)
Figure 5	Trend Analysis — Trends Over Time page	Section Example 3	8, Default (unfiltered)
Figure 6	Scholarship Distribution — Financial & Scholarship page	Section 9 (below)	Default (unfiltered)
Figure 7	Combined Filters Example	Section Example 4	8, Not yet captured

Figure 6. Scholarship Distribution — Financial & Scholarship page, showing the % Free / % Paid KPI cards, the Free vs Paid donut chart, the Avg Microscholarship by Category bar chart, the Currency Distribution chart, and the Duration Units chart, in its default (unfiltered) state.

3.10. Dashboard Best Practices

- Apply the **Category**, **Location**, or **Select date range** filter before interpreting a KPI card, since KPI values reflect the current filter state rather than always the full dataset.
- Compare KPI cards across pages rather than relying on a single page in isolation. For example, cross-check the **Overview** page's % Remote Opportunities against the more detailed breakdown on the **Location Distribution** page.

- When interpreting trend charts, distinguish a partial period (such as **2026**, which the dataset covers only through **May 28**) from a complete calendar year to avoid misreading a partial-year total as a decline.
- Use averages (e.g., **Avg Microscholarship**) alongside the standard/mode value shown separately, since several of the dashboard's underlying fields are right-skewed and averages can be pulled upward by a small number of high values.
- Read each page's **"How to Read This Page"** and **"Key Observations"/"Key Insights"** text box alongside its charts, since these are provided directly on the dashboard to guide interpretation.
- Since no dedicated data-refresh indicator beyond the static **"Data Last Updated"** timestamp is visible, treat the dashboard as reflecting a fixed snapshot rather than live data (see Section 11).

3.11. Dashboard Limitations

3.11.1 Current Dashboard Limitations

- No drill-down functionality is implemented; all visuals present a single level of granularity.
- No dedicated reset/clear-filters control is visible.
- No search functionality is visible on any page.
- Export options could not be confirmed: a menu (three-dot icon) is visible in the top navigation bar, consistent with standard report-level options, but its contents were not captured in the supplied screenshots.
- Every page footer displays the notice **"Data Last Updated: 7/26/2026 3:08:09 PM (Some items on the page have not been updated)"** — this is a built-in caveat from the dashboard platform itself, indicating the report does not guarantee that every visual reflects the same refresh timestamp.
- No live or scheduled data-refresh mechanism is visible; the dashboard reflects a static, fixed extract of the dataset rather than a real-time feed.

3.11.2 Dataset Limitations

- Location information is unavailable for **1,455 records (25.39% of the dataset)**; remote-vs-physical conclusions apply only to records where location is populated.
- Only one record in the entire dataset is identified as a physical (non-remote) opportunity, which limits any location-based comparison beyond a remote/not-specified split.
- No outreach-channel or marketing-source field exists in the dataset; an Outreach Analysis could not be produced for this reason, consistent with the Week 3 narrative report's own note on this gap.
- The dataset captures opportunity listings, not learner applications or engagement; posting-volume trends should not be read as user-demand trends.

3.11.3 Assumptions

- KPI formulas in Section 4 are inferred from displayed values and field-name labels, not from a visible formula definition, and should be verified by the dashboard's builder.
- Filter combination behavior (Section 6.2, Section 8 Example 4) is assumed to follow standard cumulative (AND) filtering, consistent with common dashboard-platform behavior, but was not independently verified through interaction.

3.11.4 Future Enhancements

- Add a dedicated reset/clear-filters control to each page.
- Add drill-down hierarchies where relevant (e.g., **Category** → **Sub-category**, **Year** → **Month** → **Day**) if such hierarchies exist in the underlying data model.
- Introduce an outreach/channel field at the data-capture stage to enable a genuine Outreach Analysis page in a future iteration.

3.11.5 Items Requiring Live Dashboard Confirmation

The following interaction details could not be established from the supplied static screenshots, since each requires clicking, hovering, or opening a control on the live report rather than reading a fixed image. They are listed here as a single action list for whichever team member next has the live report open, rather than as scattered inline notes throughout the guide.

- **Category and Location filters (Section 5):** confirm whether each supports selecting more than one value at a time, and confirm which underlying date field the "**Select date range**" control applies to (created_at_date or another field).
- **Cross-filtering versus cross-highlighting (Section 6.3):** confirm whether clicking a chart element fully filters the other visuals, dims/highlights them while keeping totals visible, or both, and capture one screenshot of the resulting state.
- **Tooltips (Section 6.4):** confirm whether hovering over a chart element displays a tooltip, and what fields it shows.
- **Bookmarks (Section 6.8):** confirm whether any saved-view or bookmark functionality exists, e.g., under the top-right ☰ menu.
- **Reset/clear-filters control (Section 6.6, Section 7):** confirm whether a reset control exists anywhere on the page (including the ☰ menu) and document the exact step if so.
- **Combined-filter screenshot (Section 8, Example 4; Figure 7):** capture one screenshot with **Category = Internship**, **Location = Virtual**, and **Date Range = 2024** applied together, showing the resulting KPI cards and visuals.

3.12. Conclusion

The Week 3 Insight Dashboard provides a comprehensive five-page interactive view of the Opportunity dataset, enabling users to explore overall catalog composition, category-level performance, posting trends over time, location and delivery distribution, and financial and scholarship characteristics. Each dashboard page integrates KPI cards, charts, tables, and contextual guidance, while maintaining a consistent layout, navigation structure, and interactive filtering experience through the **Category**, **Location**, and **Select date range** filters.

This Dashboard Features & User Guide has documented the dashboard's layout, visual components, KPI cards, filters, navigation, and interactive capabilities. It also identifies the current limitations of the dashboard, documents assumptions made during analysis, and outlines potential enhancements for future versions. Features that could not be confirmed directly from the available dashboard evidence have been clearly identified rather than inferred, ensuring the report remains accurate, transparent, and technically reliable.

Overall, the dashboard transforms the cleaned Opportunity dataset into an intuitive and user-friendly analytical platform that supports efficient data exploration, interactive analysis, and business decision-making. By combining visual storytelling with interactive filtering and clear interpretation guidance, the dashboard enables stakeholders to quickly identify important trends, compare opportunity categories, evaluate location and financial distributions, and derive meaningful insights without directly accessing the underlying dataset.

This Dashboard Features & User Guide serves as **Section 3** of the Week 3 **Dashboard Development & Insight Generation Report** and complements the **Executive Summary & Dashboard Overview**, **Data Analysis & Business Insights**, and **Recommendations & Conclusion** sections. Together, these sections provide a complete overview of the dashboard's design, functionality, analytical capabilities, and the business insights it supports.

Data Analysis & Business Insights

4.1 Opportunity Sign-up Analysis

The opportunity portfolio consists of **5,730 records distributed across 10 categories**, with a clear concentration in career-oriented opportunities. **Internships represent the largest category with 1,591 opportunities (27.77%)**, followed by **Career with 1,087** and **Competition with 734**. Together, these three categories account for approximately **59.5% of all opportunities**, indicating that the portfolio is strongly oriented toward internships, career development, and competitive engagement. This concentration is also consistent with the category-level patterns identified during the Week 2 exploratory analysis.

Figure 4.1: Sign-up and Category Performance Analysis

Source: Week 3 Opportunity Dataset Insight Dashboard – Team 14

At the other end of the distribution, **XploreU and Program contain only two opportunities each**, while Jobsimulation contains 198. The substantial difference between the largest and smallest categories demonstrates that opportunities are **not evenly distributed across the portfolio**. The average category size of **573 opportunities** therefore needs to be interpreted carefully, as it is influenced by the substantially larger Internship and Career categories.

The category-level analysis also reveals differences in the financial characteristics of the opportunities. **Competition records the highest average microscholarship among the major categories at 203.34**, followed closely by **Event at 201.02** and **Masterclass at 188.31**. In contrast, Career opportunities have the highest average fee among the major categories at **184.98**, considerably above Internship (**60.97**) and Course (**39.46**). These differences indicate that opportunity categories vary not only in volume but also in their associated financial characteristics.

The free-versus-paid distribution further shows that **free opportunities dominate most categories**, although the relative contribution of paid opportunities varies across categories. From a business perspective, the strong presence of Internship and Career opportunities suggests that these categories form the core of the current opportunity portfolio, while the variation in fees and scholarship values demonstrates distinct participation and value structures across different opportunity types.

From a business perspective, the concentration of opportunities within **Internship, Career, and Competition** establishes these categories as the principal components of the current opportunity portfolio. At the same time, differences in category volume, fees, and microscholarship values reveal distinct participation and value structures across opportunity types, providing a useful basis for category-level performance monitoring and future portfolio evaluation.

4.2 Application Trends

The temporal analysis covers opportunity creation activity from **August 2022 to May 2026**, representing approximately **46 months of recorded activity**. The yearly distribution shows a rapid increase from **25 opportunities in 2022** to **2,123 in 2023**, followed by a marginal increase to **2,127 in 2024**, making 2024 the highest-volume year in the observed dataset. Together, **2023 and 2024 account for 4,250 records, approximately 74.2% of all dated opportunities**, establishing this period as the primary concentration of opportunity creation activity.

Figure 4.2: Opportunity Posting Trends Over Time
Source: Week 3 Opportunity Dataset Insight Dashboard – Team 14

Following the 2023–2024 peak, the number of recorded opportunities decreases to **895 in 2025** and **556 in 2026**. However, the 2026 figure represents only a **partial year**, as the dataset extends only through **May 28, 2026**. Therefore, the 2026 count should not be directly compared with complete calendar years or interpreted as evidence of a full-year decline.

At the monthly level, opportunity creation demonstrates noticeable fluctuations rather than a uniform posting pattern. The dashboard identifies **April as the strongest month overall with 1,102 opportunities**, while **November records the lowest activity with 184 opportunities**. The monthly trend visualization

also shows pronounced peaks around **April 2023 and April 2024**, indicating that posting activity was particularly concentrated during these periods.

The sharp expansion between 2022 and 2023 also requires contextual interpretation. While the dashboard clearly establishes the increase in recorded opportunity volume, the available dataset alone cannot determine whether this resulted from **organic platform growth, operational scaling, changes in data capture, or historical data migration**. Similarly, the lower volumes observed after 2024 should not independently be interpreted as a deterioration in business performance without supporting engagement or operational data. This limitation was also identified during the exploratory analysis.

From a business perspective, the temporal distribution identifies **2023–2024 as the platform's most significant period of recorded opportunity activity** and highlights substantial month-to-month variation in listing volume. These patterns provide a useful historical baseline for monitoring future opportunity creation and identifying recurring periods of higher or lower platform activity, while emphasizing the need to distinguish observed listing trends from broader conclusions about business growth or user engagement.

4.3 Location Analysis

The location analysis reveals that the opportunity portfolio is **predominantly remote-oriented**. Of the **5,730 total opportunities**, the dashboard classifies **4,274 records (74.59%) as remote**, comprising **2,356 Work From Home opportunities** and **1,918 Virtual opportunities**. Only **one record is identified as a physical opportunity**, highlighting the strong prevalence of digitally accessible opportunity formats within the available location data.

Figure 4.3: Location Distribution and Remote Opportunity Analysis
Source: Week 3 Opportunity Dataset Insight Dashboard – Team 14

An important consideration in interpreting this distribution is **location-data completeness**. Location information is unavailable for **1,455 records (25.39% of the dataset)**. Among the **4,275 records where location is available**, Work From Home and Virtual opportunities collectively account for **4,274 records**

(99.98%). Therefore, while the available evidence strongly indicates a remote-oriented delivery model, this finding should not be generalized to records for which location information is missing.

The category-level breakdown shows that remote delivery is not concentrated within a single opportunity type. **Internship has the largest Work From Home presence with 699 records**, while **Career records 450** and **Competition records 293**. Virtual opportunities are similarly distributed across major categories, with **Internship contributing 542**, followed by **Career with 386** and **Competition with 262**. This indicates that remote accessibility extends across the major segments of the opportunity portfolio rather than being restricted to a particular category.

The dashboard also reports a **Remote-to-Physical ratio of 4,274:1**, further demonstrating the substantial imbalance between remote and location-bound opportunities within records containing usable location information. However, because approximately one-quarter of the dataset lacks location values, the ratio should be interpreted as a characteristic of the **known-location subset**, rather than as an absolute representation of the entire portfolio.

From a business perspective, the dominance of Work From Home and Virtual formats indicates that the current opportunity ecosystem is structured primarily around **location-independent participation**. This potentially enables opportunities to reach participants beyond specific geographical boundaries and supports broader accessibility. At the same time, the **25.39% location-data gap** limits the precision of geographical segmentation and should remain an important consideration whenever location-based performance is interpreted or communicated.

4.4 Outreach & Scholarship Analysis

The financial and scholarship analysis indicates that the opportunity portfolio is largely structured around **low-cost or free participation**. The dashboard reports that **78.85% of opportunities are free**, while **21.10% are paid**, demonstrating that paid opportunities represent a considerably smaller segment of the overall portfolio. This pattern is consistent with the Week 2 EDA, where the **median fee was 0**, confirming that a typical opportunity does not carry a participation fee.

Figure 4.4: Financial and Microscholarship Distribution Analysis

Source: Week 3 Opportunity Dataset Insight Dashboard – Team 14

The dashboard reports an **average microscholarship of approximately 168**, while the **standard microscholarship value is 120**. The underlying EDA provides additional context: microscholarship values exhibit a right-skewed distribution, with a **median and mode of 120**, while a smaller number of substantially higher values raise the overall average. Similarly, the fee distribution is highly right-skewed, meaning average fee values can be disproportionately influenced by a relatively small high-fee segment.

Currency distribution is heavily concentrated in **USD, with 4,698 records**, compared with **355 INR** and **334 EUR** records among opportunities where currency information is available. The EDA identifies USD as approximately **87.2% of the 5,387 non-null currency records**, establishing it as the dominant recorded currency within the portfolio.

Category-level scholarship patterns reveal further variation in the financial structure of opportunities. Among the major categories, **Competition records the highest average microscholarship at 203.34**, followed by **Event at 201.02**, **Masterclass at 188.31**, and **Course at 178.87**. Internship, the largest opportunity category by volume, records an average microscholarship of **155.72**. These differences suggest that scholarship values are not uniformly distributed across opportunity types and that individual categories follow different incentive structures.

The Week 2 analysis also found only a **weak positive correlation between fee and microscholarship ($r = 0.2409$)**, while duration showed negligible relationships with both fee and microscholarship. Consequently, higher participation fees are not consistently associated with proportionately higher scholarship values, and opportunity duration does not provide a meaningful indication of either cost or scholarship level.

From a business perspective, the combination of a **predominantly free opportunity portfolio**, a standardized microscholarship level around **120**, and category-specific variations in financial incentives indicates a differentiated participation model. The substantial skew in both fee and microscholarship distributions also means that **median and category-level measures provide more representative context than averages alone** when evaluating the financial characteristics of the opportunity portfolio.

Note on outreach: The stated requirement includes *Outreach & Scholarship Analysis*, but the supplied dashboard and Week 2 EDA do **not contain a dedicated outreach/source-channel variable or outreach-performance visualization**. I would not fabricate an outreach analysis. In the final report, this subsection can remain financially focused unless the team has a separate outreach-channel field or visual that hasn't been shared yet.

4.6 Key Findings

The dashboard analysis, supported by the exploratory findings from Week 2, highlights several patterns across the opportunity portfolio:

- **Career-oriented opportunities dominate the portfolio.** Internship is the largest category with **1,591 opportunities (27.77%)**, followed by Career (**1,087**) and Competition (**734**). Together, these three categories represent approximately **59.5% of all opportunities**, indicating a strong concentration around career development and skill-building segments.
- **Opportunity creation was concentrated in 2023–2024.** The dataset records **2,123 opportunities in 2023** and **2,127 in 2024**, collectively accounting for approximately **74.2% of dated records**.

Monthly activity also varies considerably, with the dashboard identifying **April as the strongest month with 1,102 opportunities** and November as the lowest with 184. The lower 2026 volume should be interpreted cautiously because the dataset covers only through **May 28, 2026**.

- **Remote delivery overwhelmingly characterizes records with available location information.** The dashboard identifies **2,356 Work From Home** and **1,918 Virtual** opportunities, compared with only **one physical-location record**. However, **1,455 records (25.39%) lack location information**, meaning location conclusions should remain scoped to records where this information is available.
- **Free opportunities form the majority of the portfolio.** The dashboard reports **78.85% of opportunities as free**, compared with **21.10% paid**. This is consistent with the EDA finding of a **median fee of 0**, while the highly right-skewed fee distribution indicates that a smaller high-fee segment substantially influences average values.
- **Microscholarships exhibit a relatively standardized central value but substantial variation.** The dashboard reports an average microscholarship of approximately **168** and a standard value of **120**. The EDA further identifies **120 as both the median and mode**, suggesting a common incentive level, while higher-value observations create a right-skewed distribution.
- **Financial characteristics vary meaningfully across opportunity categories.** Competition records the highest average microscholarship among the major categories at **203.34**, while Career records the highest average fee at **184.98**. This indicates that different opportunity categories follow distinct cost and incentive structures rather than a uniform financial model.
- **USD is the dominant recorded currency.** Of the **5,387 records with available currency information**, **4,698 (87.2%) use USD**, compared with 355 INR and 334 EUR records, indicating a strong concentration around USD-denominated opportunities.
- **Cost, scholarship value, and duration are largely independent characteristics.** The EDA identifies only a weak positive relationship between fee and microscholarship ($r = 0.2409$) and negligible relationships between duration and fee ($r = 0.0238$) and duration and microscholarship ($r = -0.0160$). Therefore, opportunity duration does not meaningfully explain its cost or scholarship value.

Overall, the findings portray an opportunity portfolio concentrated around **career-focused, predominantly remote, and largely free offerings**, with substantial variation across categories in volume and financial characteristics. The temporal and financial patterns provide useful context for understanding the composition of the portfolio, while identified data-coverage limitations—particularly for location—remain important when interpreting dashboard-level results.

4.7 Business Insights

The combined dashboard and exploratory analysis indicate that the opportunity portfolio is positioned primarily around **career development, digital accessibility, and low-cost participation**. Internship, Career, and Competition collectively account for approximately **59.5% of all opportunities**, establishing these segments as the principal components of the portfolio. This concentration suggests that the platform's current opportunity mix is strongly aligned with users seeking professional development, practical experience, and competitive learning opportunities.

The predominance of **Work From Home and Virtual opportunities** among records with known location information further indicates a highly digital delivery model. Such a structure reduces geographical dependence and potentially enables opportunities to serve participants across wider markets. However,

because **25.39% of records lack location information**, the available evidence supports a strong remote orientation but does not justify treating it as an absolute platform-wide characteristic.

From a participation-cost perspective, the dashboard's **78.85% free-opportunity share**, together with the EDA's median fee of **0**, indicates relatively low financial barriers across much of the portfolio. At the same time, the highly skewed fee distribution demonstrates the presence of a smaller higher-cost segment. Consequently, viewing free/standard and higher-cost opportunities as distinct segments provides more meaningful business context than relying solely on portfolio-wide average fees.

Microscholarships represent another differentiated element of the opportunity model. A standard value of **120** appears prominently in the data, while category-level averages vary considerably. Furthermore, the weak relationship between fee and microscholarship ($r = 0.2409$) indicates that higher-cost opportunities do not consistently provide proportionately higher scholarship values. This suggests that pricing and incentive structures are influenced by factors beyond opportunity cost alone.

The temporal analysis identifies **2023–2024 as the principal period of recorded opportunity activity**, accounting for approximately 74.2% of dated records. Monthly variations, including particularly high activity in April, further demonstrate that opportunity creation is not uniformly distributed over time. These patterns can provide a historical benchmark for future performance comparisons; however, they should not independently be interpreted as changes in user demand or business growth because the dataset captures **opportunity listings rather than user engagement or application behavior**.

Overall, the analysis identifies a portfolio characterized by **career-focused categories, remote accessibility, predominantly free participation, and differentiated financial incentives**. These characteristics provide stakeholders with a clearer understanding of the current opportunity mix and establish an analytical baseline for evaluating category composition, accessibility, financial structure, and posting activity over time.

Recommendations & Conclusion

This section closes the Week 3 report by translating the findings documented in Section 4 (Data Analysis & Business Insights) and the dashboard functionality documented in Section 3 (Dashboard Features & User Guide) into a set of actionable recommendations, followed by an overall summary of the Week 3 deliverable and a conclusion. Recommendations below are drawn directly from patterns and limitations already identified elsewhere in this report; no new data claims are introduced here.

5.1 Actionable Recommendations

The recommendations are grouped into five areas: data quality and governance, category and portfolio strategy, location and accessibility, financial and incentive structure, and dashboard/reporting enhancements. Each recommendation is tied to a specific finding from Section 4 or a limitation documented in Section 3.

5.1.1 Data Quality & Governance

- Fix the deadline-validation bug. 361 records were found where the last date to apply falls before the record's creation date. Backend validation should be introduced at data entry to prevent opportunities from being published with an already-expired or logically invalid apply-by date.
- Close the highest-priority data gaps. The archive status field (90% missing) and the role-responsibility field (81% missing) should be made mandatory or auto-populated at intake, since both currently limit historical tracking and the descriptive value of listings for applicants.
- Make location capture mandatory. With 25.39% of records missing location data, the platform's remote-first positioning cannot currently be confirmed for roughly a quarter of the portfolio. Requiring a location value at submission would let future reporting state a remote/physical split for the full dataset rather than the known-location subset only.

5.1.2 Category & Portfolio Strategy

- Prioritize category-level review around the core three. Internship, Career, and Competition together make up approximately 59.5% of the portfolio. Content-quality review, applicant support, and future feature development should be prioritized around these three categories first, since they carry the largest share of user-facing impact.
- Evaluate the smallest categories for consolidation or growth. XploreU and Program each contain only two opportunities. The business should decide whether to actively grow these categories, merge them into a related category, or retire them, rather than leaving them at a scale too small to evaluate meaningfully.

5.1.3 Financial & Incentive Structure

- Report fees and microscholarships using median and category-level figures, not portfolio-wide averages. Both fields are highly right-skewed (median fee of 0 against a maximum of 200,000; a microscholarship median/mode of 120 against an average of 168), so an average-only view would misrepresent the typical opportunity.
- Treat free/standard and high-fee opportunities as distinct segments. With 78.85% of opportunities free and a small higher-fee segment driving most of the fee variance, a segmented

marketing and reporting approach would better reflect the two different participation models already present in the data.

- Investigate the fee outlier records. The maximum recorded fee of 200,000 is an extreme outlier relative to the rest of the distribution and should be verified as a genuine high-end offering rather than a data-entry error before it is used in any external-facing report.

5.1.4 Location & Outreach Data

- Introduce an outreach/source-channel field at data capture. As noted in Section 4.4 and Section 3 (Section 11.2, 11.4), the dataset currently has no field identifying how an opportunity was sourced or promoted, so an outreach-channel analysis could not be produced in Week 3. Adding this field would allow a genuine outreach-performance page in a future dashboard iteration.
- Pair posting-volume metrics with engagement data going forward. The dataset captures opportunity listings, not applications or user engagement. The 2025–2026 decline in posting volume should not be read as a drop in business performance without a corresponding engagement or application dataset to confirm it.

5.1.5 Dashboard & Reporting Enhancements

- Add a reset/clear-filters control. No such control currently exists on any of the five dashboard pages (Section 3, Section 6.6), which makes it easy for a user to misread a filtered view as the full dataset.
- Add drill-down hierarchies where the data supports them. Category → sub-category and Year → Month → Day hierarchies would let users move from the current single level of granularity into more detail without leaving the page (Section 3, Section 6.1, 11.4).
- Verify inferred KPI formulas before external publication. Several KPI calculations in Section 3 (Section 4 of that document) were inferred from displayed values rather than confirmed against the dashboard's live field definitions, and should be signed off by the dashboard owner.

5.2 Business Value

Implementing the recommendations above would translate directly into business value across three areas: decision confidence, operational efficiency, and reporting credibility.

- Decision confidence. Closing the location (25.39% missing) and archive-status (90% missing) data gaps would let stakeholders state remote-vs-physical and lifecycle conclusions for the full 5,730-record portfolio rather than a subset, so that category, location, and financial decisions can be made with fewer caveats.
- Operational efficiency. Fixing the deadline-validation bug (361 affected records) would prevent applicants from encountering opportunities with an already-expired apply-by date, directly improving user experience without requiring new data collection.
- Reporting credibility. Reporting fee and microscholarship figures at the median/category level rather than as portfolio-wide averages, and clearly scoping remote-delivery claims to records with known location, would make future reports more defensible to stakeholders who scrutinize the underlying numbers.

- **Prioritized resourcing.** Since Internship, Career, and Competition already account for approximately 59.5% of the portfolio, focusing content-review and applicant-support effort on these three categories concentrates limited team resources where they affect the largest share of users.
- **A foundation for outreach measurement.** Introducing an outreach/source-channel field, while not something this report's dataset currently supports, would give the business its first ability to measure which acquisition channels actually drive sign-ups, rather than only how many opportunities are posted.

5.3 Future Improvements

Beyond the immediate recommendations in Section 5.1, the following improvements would extend the value of both the dataset and the dashboard in future iterations:

- **Outreach-channel tracking.** Add a source/channel field at data-capture stage so a genuine Outreach Analysis page can be built in a future dashboard version, closing the gap noted in Section 4.4 and Section 3.
- **Drill-down hierarchies.** Introduce Category → Sub-category and Year → Month → Day hierarchies once the underlying data model supports them, rather than the single level of granularity currently available on every chart.
- **Reset and search controls.** Add a dedicated reset/clear-filters control and a search function to each page, neither of which is currently implemented.
- **Engagement and application data.** Pair the existing opportunity-listing data with actual application or engagement data in a future cycle, so that posting-volume trends (such as the 2025–2026 decline) can be validated against real user demand instead of listing volume alone.
- **Confirmed KPI definitions.** Have the dashboard owner formally confirm the KPI formulas currently inferred in Section 3, and document them alongside the dashboard rather than relying on displayed values alone.
- **Live-interaction verification.** Confirm the remaining items listed in Section 3 (Section 11.5) — multi-select filter behavior, tooltip content, export menu options, and bookmark support — against the live report rather than static screenshots.

5.4 Conclusion

Taken together, Sections 1 through 5 of this report document a career-focused, predominantly remote, and largely free opportunity portfolio of 5,730 records, presented through an interactive five-page dashboard and interpreted against the Week 1–2 cleaning and exploratory analysis. The actionable recommendations in Section 5.1 target the specific data-quality, category, financial, and dashboard-usability gaps identified during Week 3; the business value in Section 5.2 explains why closing those gaps matters; and the future improvements in Section 5.3 set a direction for subsequent iterations of both the dataset and the dashboard, so that later reporting cycles can support more complete and more confidently generalizable business conclusions.

The Week 3 Insight Dashboard (Team 14) referenced throughout this report is published on Google Looker Studio and can be accessed via the following link:
